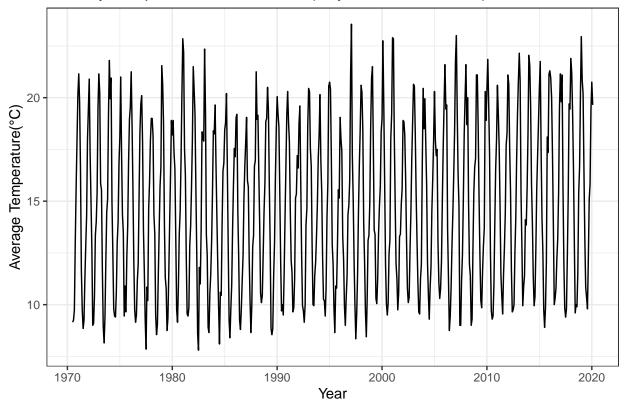

## Graphical exploration of the data.

#### Time series plot

```
autoplot(tempts_mean, main = "Monthly Temperature in Melbourn (July 1997 - Feb 2020)",

→ ylab = "Average Temperature(\u00B0C)", xlab = "Year") + theme_bw()
```

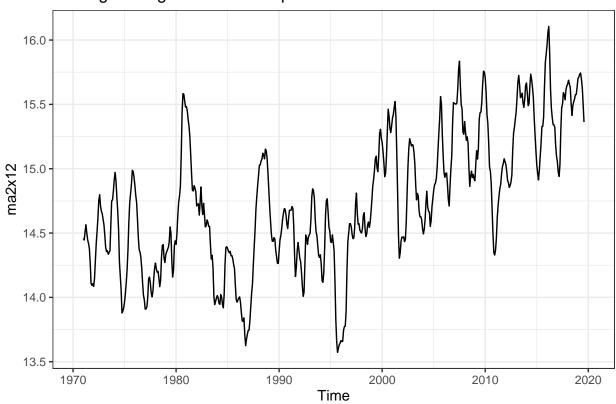

## Monthly Temperature in Melbourn (July 1997 - Feb 2020)

### Moving average (ma)

```
ma2x12 <- ma(tempts_mean, order=12, centre=TRUE)
autoplot(ma2x12, main = "Moving Average of Mean Temperature") + theme_bw()</pre>
```

## Moving Average of Mean Temperature

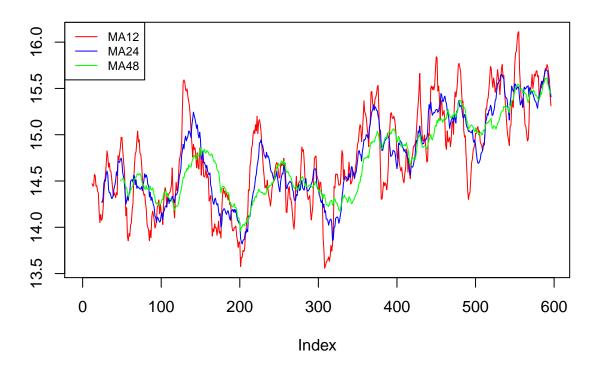

#### End-point ma to show trend

```
#define a function for backwards MA
ma_bk=function(y, order, ...){
   ma<-matrix(0,nrow(y),1)
   for(i in order:nrow(y))
   {
      ma[i]<-mean(y[i-order+1:order])
   }
   ma[1:(order-1)]=NA
   return(ma)
}</pre>
```

```
tp_mean =as.matrix(temp$Mean)

tp_ma12=ma_bk(tp_mean,12) # number of week days
```

## **Backward Moving Averages of Mean Temperature**

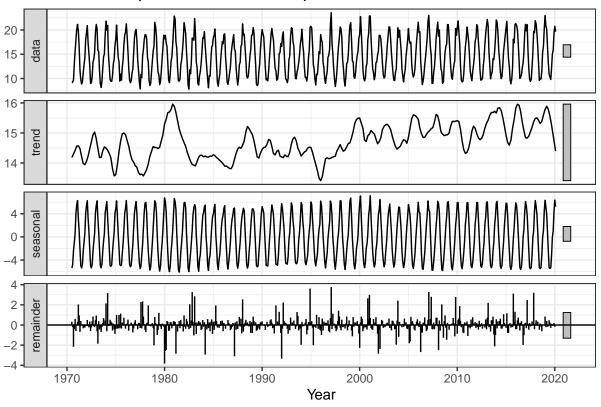

Fluctuation, intersection, increasing and decreasing trend.

## Time series decomposition of the data - $\operatorname{stl}$

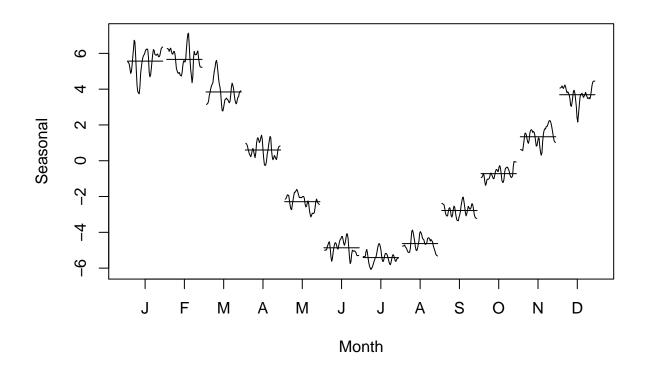

```
fitstl = tempts_mean %>% stl(t.window = 12, s.window = 6, robust = TRUE) # STL

    decomposition
fitstl%>% autoplot()+ xlab("Year") +
    ggtitle("STL Decomposition of Mean Temperature") +theme_bw()
```

STL Decomposition of Mean Temperature

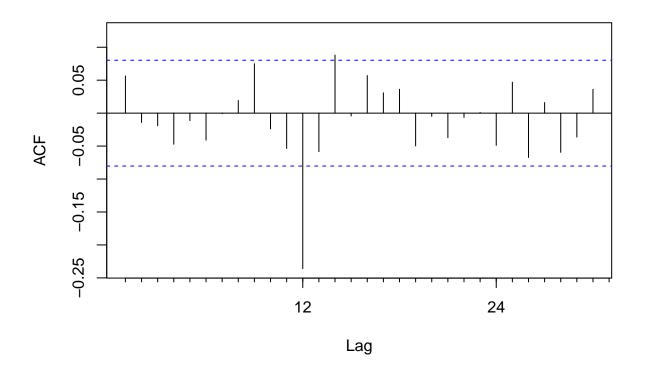

monthplot(fitstl\$time.series[, "seasonal"], main = "", ylab = "Seasonal", xlab = "Month")

```
stl_res = remainder(fitstl)
Acf(stl_res,lag.max=30, main = "Remainder of STL Decomposition")
```

## **Remainder of STL Decomposition**
